Task 2:

Step 1:

- SYN Initiates a connection.
- SYN-ACK Responds to the SYN.
- ACK Acknowledges the SYN-ACK and establishes the connection.

Step 2:

1. First Packet (SYN from client):

- Seq=0, Ack=0
- The client initiates the connection.

2. Second Packet (SYN-ACK from server):

- Seq=0, Ack=1
- The server acknowledges the SYN packet from the client.

3. Third Packet (ACK from client):

- Seq=1, Ack=1
- The client acknowledges the SYN-ACK packet from the server.

```

Step 5:

UDP headers are minimal, totaling only 8 bytes and containing fields like Source Port, Destination Port, Length, and Checksum. In contrast, TCP headers are more detailed, beginning at 20 bytes and featuring extra fields such as Sequence Number, Acknowledgment Number.

Part 4:

Task 1:

Category		Reasons
Reliability and Connection Establishment	TCP	TCP is a connection-oriented protocol, which means it establishes a connection using a three-way handshake (SYN, SYN-ACK, ACK). It ensures reliable data transmission by acknowledging received packets and re-sending lost packets.
Data Integrity and Ordering	TCP	TCP ensures data integrity and maintains the correct order of packets. It assigns sequence numbers to packets, ensuring that data is received in the order it was sent. If any packets are missing or out of order, TCP will correct this by reordering or retransmitting them.

Task 2:

	TCP	UDP
Use Cases	File Transfer	Streaming
Performance	Slower due to connection establishment (3-way handshake), packet retransmission, and error checking.	Faster because it is connectionless and does not require acknowledgments or retransmissions.
